2015 SPYDERCO FORUM CALENDAR CONTEST

Sunday

Monday

Tuesday

Wednesday

Thursday

Friday

Saturday

Jens Anso artistically created the texture on his custom Zulu with a grinder. We reverse engineered that original texture to make all the handles of the production models identical to his original pattern.

Unlike blade shapes with "belly" to the edge, the Wharnccliffe profile's perfectly straight cutting edge cuts with full power all the way to the point. For self-defense applications, it maximizes the performance of small knives.

The cutting dynamics of the hawkbill blade are different than standard blade profiles. It pierces with the point and draws the material being cut toward the inside of the curved edge—much like an animal's claw.

2015 September

The Delica's VG-10 blade is full-flat ground with a strong tip and large 13mm opening hole. Added to the blade's spine is slip resistant jimping. Phosphor bronze washers smooth out the open/close action and the clip is upgraded to a four-way tip-up, tip-down, left- or right-handed clip.

The Delica's FRN (fiberglass reinforced nylon) handle comes in new vibrant tones including blue, green, brown, gray and purple. Molded onto the handle's surface is Bi-Directional Texturing for slip-free tactile traction. Inside the handle are dual skeletonized stainless steel liners which strengthen the knife without additional weight.

GLOSSARY STEEL ELEMENTS

CARBON (C)
Increases edge retention and raises tensile strength. Increases hardness and improves resistance to wear and abrasion.

CHROMIUM (CR)
Increases hardenability, tensile strength and toughness. Provides wear and corrosion resistance. Above 12% it yields what is generally acknowledged as stainless steel.

COBALT (CO)
Increases strength and hardness, and permits quenching in higher temperatures. Intensifies the individual effects of other elements in more complex steels.

NIObIUM (NB) (colombium)
Relative to knife blade applications, Niobium readily forms NbC carbide within the microstructure which is an extremely stable and hard form of metal carbide. Such carbides provide excellent wear resistance and edge retention for a blade application.

COPPER (CU)
Increases corrosion resistance.

MANGANESE (MN)
Increases hardenability, wear resistance and tensile strength. Deoxidizes and degasifies to remove oxygen from molten metal. In larger quantities, increases hardness and brittleness.

MOLYBDENUM (MO)
Increases strength, hardenability and toughness of steel. Improves machinability and resistance to corrosion. Prevents high temperature creep. Helps retain fine grain size and is an effective substitute for tungsten in many high-speed tool steels.

NICKEL (NI)
Adds strength and toughness

NITROGEN (N)
Used in place of carbon for the steel matrix. The nitrogen atom will function in a similar manner to the carbon atom but offers unusual advantages in corrosion resistance.

PHOSPHORUS (P)
Improves strength, machinability and hardness. Creates brittleness in high concentration.

SILICON (SI)
Increases strength. Deoxidizes and degasifies to remove oxygen from molten metal.

SULFUR (S)
Improves machinability when added in minute quantities, but can decrease toughness.

TUNGSTEN (W)
Adds strength, toughness and improves hardenability.

VANADIUM (V)
Increases strength wear resistance and increases toughness. Limits grain size.

Integrity is being good even if no one is watching.™
